

In **Geometric Optics**, students discover how an image is formed by a lens or mirror using ray diagrams.

С помощью этого симулятора учащиеся узнают, как изображение формируется линзами или зеркалами, используя ход лучей в оптических приборах.

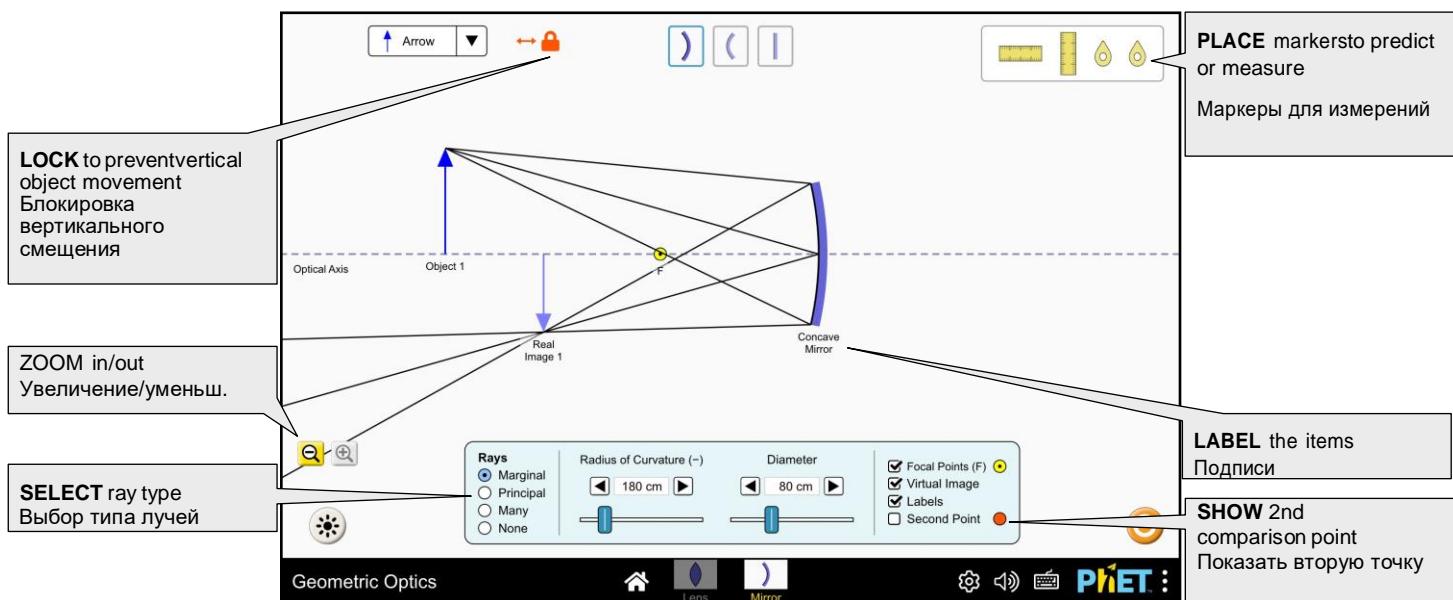

**Lens Screen (Экран «Линзы»)** Determine how radius of curvature and index of refraction affect the focal length of a lens. Create real and virtual images and experiment with a spotlight.

Определите, как радиус кривизны и показатель преломления влияют на фокусное расстояние линзы. Создавайте реальные и виртуальные изображения и экспериментируйте с прожектором.

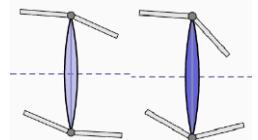

## Mirror Screen (Экран «Зеркало»)

Explore spherical and flat mirrors. Adjust the radius of curvature and diameter of the mirror and observe the effects on the image position, magnification, and brightness. Исследуйте сферические и плоские зеркала. Отрегулируйте радиус кривизны и диаметр зеркала и понаблюдайте за влиянием на положение изображения, увеличение и яркость.

## Complex Controls

- The Preferences menu can be used to change the focal length controls and enable the 2F Points checkbox.
- The light propagation toggle button which hides the rays/image/light spot and can be used for predictions or triggering the ray tracing animation.
- To constrain the movement of the object to horizontal motion only, use the lock button next to the object selection menu.
- The Guides feature can be enabled using the `addGuidesCheckbox` query parameter. The Guides indicate the extent to which light refracts through a lens, and the angle between the guide arms is proportional to the focal length. The Guides may be useful when predicting the location of the image, or can be used to emphasize the way light is focused. The Guides will align to the Marginal Rays when the object distance is twice the focal length.

## Сложные элементы управления

- Меню настроек можно использовать для изменения параметров фокусного расстояния и включения флашка 2F точек.
- Кнопка переключения распространения света, которая скрывает лучи/изображение/световое пятно и может использоваться для прогнозирования или запуска анимации трассировки лучей.
- Чтобы ограничить перемещение объекта только горизонтальным движением, используйте кнопку блокировки рядом с меню выбора объекта.
  - Функцию направляющих можно включить с помощью параметра запроса флашка «Добавить направляющие». Направляющие указывают угол преломления света через олинзу, а угол между ними пропорционален фокусному расстоянию. Направляющие могут быть полезны при прогнозировании местоположения изображения или могут использоваться для выделения способа фокусировки света. Направляющие будут выровнены по краевым лучам, когда расстояние до объекта в два раза превышает фокусное расстояние.

## Insights into Student Use

- Students may experiment with placing the object at the focal point. However, this is not possible for all optics, as the minimum object distance is 40 cm.
- Students may need scaffolding to interpret the image brightness when the image is smaller than the object. When  $|M|<1$  the light forming the image is more intense, so changes in object distance and optic diameter will appear to have less of an effect on image brightness.

## Рекомендации по использованию учащимися

- Учащиеся могут поэкспериментировать с размещением объекта в фокальной точке. Однако это возможно не для всех оптических систем, поскольку минимальное расстояние до объекта составляет 40 см.
- Учащимся может понадобиться помочь для интерпретации яркости изображения, когда изображение меньше объекта. Когда  $|M|<1$ , свет, формирующий изображение, более интенсивен, поэтому изменения расстояния до объекта и оптического центра, по-видимому, оказывают меньшее влияние на яркость изображения.

## Suggestions for Use

### Sample Challenge Prompts

- Sketch the formation of an image using principal rays.

- Determine the relationship between radius of curvature, index of refraction, and focal length of a lens.
- Describe the relationship between the radius of curvature and focal length of a mirror.
- Explain the difference between a real and virtual image.
- Find all the ways to change the brightness of the image.
- Predict where an image will be formed given the object distance and optic parameters.

## Customization Options

Query parameters allow for customization of the simulation, and can be added by appending a '?' to the sim URL, and separating each query parameter with a '&'. The general URL pattern is:

`...html?queryParameter1&queryParameter2&queryParameter3`

For example, in Geometric Optics, if you only want to include the 1st screen (`screens=1`), with the audio disabled (`audio=disabled`) use:

[https://phet.colorado.edu/sims/html/geometric-optics/latest/geometric-optics\\_all.html?screens=1&audio=disabled](https://phet.colorado.edu/sims/html/geometric-optics/latest/geometric-optics_all.html?screens=1&audio=disabled)

To run this in Spanish (`locale=es`), the URL would become:

[https://phet.colorado.edu/sims/html/geometric-optics/latest/geometric-optics\\_all.html?locale=es&screens=1&audio=disabled](https://phet.colorado.edu/sims/html/geometric-optics/latest/geometric-optics_all.html?locale=es&screens=1&audio=disabled)

⊗ Indicates this customization can be accessed from the Preferences menu within the simulation.

Query Parameter and Description	Example Links
⊗ <code>focalLengthControl</code> - specifies how the focal length is controlled, and can be either direct (focal length slider) or indirect (radius of curvature and index of refraction sliders). Default is indirect.	<code>focalLengthControl=direct</code>
⊗ <code>add2FPointsCheckbox</code> - when true, adds a checkbox to the control panel to display the 2F points. Default is false.	<code>add2FPointsCheckbox=true</code>
<code>addGuidesCheckbox</code> - when true, adds a checkbox to the control panel to display the Guides, see Complex Controls above. Default is false.	<code>addGuidesCheckbox=true</code>
<code>screens</code> - specifies which screens are included in the sim and their order. Each screen should be separated by a comma. For more information, visit the <a href="#">Help Center</a> .	<code>screens=1</code> <code>screens=2,1</code>
<code>initialScreen</code> - opens the sim directly to the specified screen, bypassing the home screen.	<code>initialScreen=1</code> <code>initialScreen=2</code>
⊗ <code>locale</code> - specify the language of the simulation using ISO 639-1 codes. Available locales can be found on the simulation page on the <a href="#">Translations tab</a> . Note: this only works if the simulation URL ends in “_all.html”.	<code>locale=es</code> (Spanish) <code>locale=fr</code> (French)
<code>audio</code> - if muted, audio is muted by default. If disabled, all audio is permanently turned off.	<code>audio=muted</code> <code>audio=disabled</code>
<code>allowLinks</code> - when false, disables links that take students to an external URL. Default is true.	<code>allowLinks=false</code>
<code>supportsPanAndZoom</code> - when false, disables panning and zooming using pinch-to-zoom or browser zoom controls. Default is true.	<code>supportsPanAndZoom=false</code>

## Model Simplifications

- The focal length,  $f$ , of the lenses is calculated using the Lens-Maker's Equation, assuming thin lenses and an equal radius of curvature,  $R$ , on both faces,  $f = R / (2(n - 1))$  where  $n$  is the index of refraction. The focal length of the spherical mirror assumes the paraxial approximation,  $f = R / 2$ .

- The Focal Length and Radius of Curvature sliders control the magnitude, and (-) is appended to the title of the control when the value is negative.
- The perspective of the picture frames implies that the observer is looking from the side. However, an observer would only see an image from this vantage point if there was a screen at the image location. This perspective was chosen to make the ray tracing and inversion/mirroring of the image clearer.
- For consistency, labels appear below the item. For objects, this means that the "Object" label may not be immediately next to the origin of the point source.
- There is a singularity when an object is placed exactly at the focal point, which may result in a flash or stutter.
- The opacity of the framed images is used to indicate its intensity, and depends on the object distance, optic diameter, and magnification of the image. An image will appear dimmer when the object is far from the optic, the optic diameter is small, or the magnification is large.
- In general, the intensity of the light spot on the projector screen is inversely proportional to its diameter. However, intensity will remain constant when the diameter of the lens changes.
- Marginal Rays and Many Rays refract/reflect only at the first point of contact with the optic. For the diverging lens, it's possible that a ray will exit through the top or bottom surface of the lens without refracting a second time.
- Principal Rays are a model used to identify the location of an image. However, due to the size of the object, these rays may not always physically reach the optic, so we extend the central axis of the optic to make the ray behavior clearer.
- Many Rays consists of a 120-degree fan of rays. The number of rays will increase with the distance of the object from the optics, so that there are always at least 2 rays incident on the optic.
- In the Light scene, rays that do not interact with the lens will not cast any light on the projection screen, because we are not modeling ambient light.
- We do not model the physics of reflected rays and they may pass over the object (rather than being blocked). However, framed objects are constrained to horizontal dragging above the optical axis so that the rays forming a real image are never obscured by the object. This same restriction is not applied to the Arrow, because it is a representation of point source, not a physical extended object.
- The 2F points can be enabled from the Preferences menu or by using the `add2FPointsCheckbox` query parameter. For mirrors, this is equivalent to the center, C. However, we chose the "2F" terminology because the feature applies to both the Lens and Mirror screens.
- For a flat mirror, the radius of curvature and focal length controls disappear, as the values are infinite.
- The flat mirror is intended for comparison purposes. Deeper exploration of flat mirrors is supported in [Geometric Optics: Basics](#), which has a centered mirror and allows for freely-moving objects.
